Flake & Nugget Ice Machine

Technician's Handbook

Safety Notices

As you work on Manitowoc equipment, be sure to pay close attention to the safety notices in this handbook. Disregarding the notices may lead to serious injury and/or damage to the equipment.

Throughout this handbook, you will see the following types of safety notices:

Warning

Text in a Warning box alerts you to a potential personal injury situation. Be sure to read the Warning statement before proceeding, and work carefully.

Caution

Text in a Caution box alerts you to a situation in which you could damage the equipment. Be sure to read the Caution statement before proceeding, and work carefully.

Procedural Notices

As you work on Manitowoc equipment, be sure to read the procedural notices in this handbook. These notices supply helpful information which may assist you as you work.

Throughout this handbook, you will see the following types of procedural notices:

Important

Text in an Important box provides you with information that may help you perform a procedure more efficiently. Disregarding this information will not cause damage or injury, but it may slow you down as you work.

NOTE: Text set off as a Note provides you with simple, but useful, extra information about the procedure you are performing.

Read These Before Proceeding:

Caution

Proper installation, care and maintenance are essential for maximum performance and trouble-free operation of your equipment. Visit our website www.manitowocfsg.com for manual updates, translations, or contact information for service agents in your area.

Important

Routine adjustments and maintenance procedures outlined in this handbook are not covered by the warranty.

Warning

Read this manual thoroughly before operating, installing or performing maintenance on the equipment. Failure to follow instructions in this manual can cause property damage, injury or death.

Warning

Do not use electrical appliances or accessories other than those supplied by Manitowoc for your ice machine model.

Warning

Two or more people or a lifting device are required to lift this appliance.

Warning

This equipment contains high voltage electricity and refrigerant charge. Installation and repairs are to be performed by properly trained technicians aware of the dangers of dealing with high voltage electricity and refrigerant under pressure. The technician must also be certified in proper refrigerant handling and servicing procedures. All lockout and tag out procedures must be followed when working on this equipment.

⚠ Warning

Do not damage the refrigeration circuit when installing, maintaining or servicing the unit.

⚠ Warning

Do not operate equipment that has been misused, abused, neglected, damaged, or altered/modified from that of original manufactured specifications. This appliance is not intended for use by persons (including children) with reduced physical, sensory or mental capabilities, or lack of experience and knowledge, unless they have been given supervision concerning use of the appliance by a person responsible for their safety. Do not allow children to play with this appliance.

⚠ Warning

All covers and access panels must be in place and properly secured, before operating this equipment.

⚠ Warning

Do not obstruct machine vents or openings.

⚠ Warning

Do not store gasoline or other flammable vapors or liquids in the vicinity of this or any other appliance.

⚠ Warning

Do not clean with water jet.

⚠ Warning

It is the responsibility of the equipment owner to perform a Personal Protective Equipment Hazard Assessment to ensure adequate protection during maintenance procedures.

⚠ Warning

Two or more people are required to move this equipment to prevent tipping.

Warning

When using electric appliances, basic precautions must always be followed, including the following:

- a. Read all the instructions before using the appliance.
- b. To reduce the risk of injury, close supervision is necessary when an appliance is used near children.
- c. Do not contact moving parts.
- d. Only use attachments recommended or sold by the manufacturer.
- e. Do not use outdoors.
- f. For a cord-connected appliance, the following must be included:
 - Do not unplug by pulling on cord. To unplug, grasp the plug, not the cord.
 - Unplug from outlet when not in use and before servicing or cleaning.
 - Do not operate any appliance with a damaged cord or plug, or after the appliance malfunctions or is dropped or damaged in any manner. Contact the nearest authorized service facility for examination, repair, or electrical or mechanical adjustment.
- g. Follow applicable lock out tag out procedures before working on equipment.
- h. Connect to a properly grounded outlet only.

NOTE: Rack units share a common refrigeration circuit with other equipment, such as display cases and glass door freezer displays. Rack units have been modified to function with rack systems and will not function correctly with RCU condensing units.

Model/Serial Number

These numbers are required when requesting information from your local Manitowoc Distributor, or Manitowoc Ice. The model and serial number are listed on the MODEL/SERIAL NUMBER DECAL affixed to the ice machine.

Manitowoc Cleaner and Sanitizer

Manitowoc Ice Machine Cleaner and Sanitizer are available in 16 oz. (473 ml) bottles. These are the only cleaner and sanitizer approved for use with Manitowoc products.

Cleaner Part Number		Sanitizer Part Number	
16 oz.	000000084	16 oz.	9405653
1 gal	N/A	1 gal.	9405813

Ice Machine Warranty Information

Warranty information for all ice machine models is available on our website at www.manitowocice.com.

*BTU/Hour

NOTE: Because the heat of rejection varies during the ice making cycle, the figure shown is an average.

THIS PAGE INTENTIONALLY LEFT BLANK

Installation

Installation Requirements

The location selected for the ice machine must meet the following criteria. If any of these criteria are not met, select another location.

- Air temperature:
- RF or RFS Flake Models - Minimum 50°F (10°C), Maximum 110°F (43°C)
- RN Nugget Models - Minimum 50°F (10°C), Maximum 100°F (38°C)
- RNS Nugget Models - Minimum 45°F (7°C), Maximum 110°F (43°C)
- The location must be free of airborne and other contaminants.
- The location must not be near heat-generating equipment or in direct sunlight.
- The location must be capable of supporting the weight of the ice machine and a full bin of ice.
- The location must allow enough clearance for water, drain and electrical connections in the rear of the ice machine.
- The location must not obstruct airflow through or around the ice machine.
- The ice machine and bin must be level.
- Routine adjustments and maintenance procedures outlined in this manual are not covered by the warranty.

Potable Water Requirements

- Plumbing must conform to local codes.
- Water temperature: Minimum 40°F (4°C), Maximum 90°F (32°C).
- Do not connect the ice machine to a hot water supply. Be sure all hot water restrictors installed for other equipment are working. (Check valves on sink faucets, dishwashers, etc.)
- If water pressure exceeds maximum pressure (70 psig [483 kPa] RN1000; 80 psig [552 kPa] for all other models) obtain a water pressure regulator from your Manitowoc distributor.
- A water shut-off valve is required to clean the ice machine.
- A union for both the ice making and condenser water lines is required.
- Water inlet lines require insulation to prevent condensation.
- RF/RFS/RFN Models: A back flow preventer is required on water inlet lines.

Drain Connections

- Drain lines must have a 1.5 inch drop per 5 feet of run (2.5 cm per meter), and must not create traps.
- The floor drain must be large enough to accommodate drainage from all drains.
- Bin drain termination must have an air gap.
- Separate insulated bin and water-cooled condenser drain lines are required.
- The bin and ice machine drains require a vent.

Ice Machine Clearance Requirements

Head Sections	Self-Contained Air-Cooled	Self-Contained Water-Cooled*	QuietQube Air-Cooled
Back	5" (12.7 cm)	5" (12.7 cm)	5" (12.7 cm)
Sides/Top	8" (20.3 cm)	8" (20.3 cm)	8" (20.3 cm)

RCU Units	Remote Condensing Unit*
Front/Back	24" (61.0 cm)
Sides/Top	6" (15.2 cm)*

NOTE: Allowance must be made for removal when the ice machine is built-in. Monthly removal of the top panel is required for cleaning and sanitizing.

Cooling Tower Applications

A water cooling tower installation does not require modification of the ice machine. The water regulator valve for the condenser continues to control the refrigeration discharge pressure.

It is necessary to know the amount of heat rejection, and pressure drop through the condenser and water valves (inlet and outlet) when using a cooling tower on an ice machine.

- Water entering the condenser must not be lower than 37°F (3°C) or exceed 90°F (32°C).
- Water flow through the condenser must not exceed 5 gal. (19 L) per minute.
- Allow for a pressure drop of 7 psi (48 kPa) between the condenser water inlet and the outlet of the ice machine.
- Water exiting the condenser must not exceed 110°F (43°C).

Electrical Service

Warning

All wiring must conform to local, state and national codes.

VOLTAGE

The maximum allowable voltage variation is $\pm 10\%$ of the rated voltage on the ice machine model/serial number plate at compressor start-up.

FUSE/CIRCUIT BREAKER

A separate fuse/circuit breaker must be provided for each ice machine. Circuit breakers must be H.A.C.R. rated (does not apply in Canada).

Warning

The ice machine must be grounded in accordance with national and local electrical codes.

GROUND FAULT INTERRUPTER CIRCUIT (GFI)

A GFCI/GFI circuit protection is not recommended with our equipment. If a GFCI/GFI is required by code a GFCI/GFI breaker rather than outlet must be used to avoid intermittent nuisance trips.

THIS PAGE INTENTIONALLY LEFT BLANK

Maintenance

Cleaning and Sanitizing

Maintenance procedures covered in this manual are not covered by the warranty.

Caution

Use only Manitowoc approved Ice Machine Cleaner (part number 000000084) and Sanitizer (part number 9405653). Do not mix Cleaner and Sanitizer solutions together. It is a violation of Federal law to use these solutions in a manner inconsistent with their labeling. Read and understand all labels printed on bottles before use.

Warning

Wear rubber gloves and safety goggles (and/or face shield) when handling ice machine Cleaner or Sanitizer.

EXTERIOR CLEANING

Remove dust and dirt off exterior surfaces with mild household dish-washing detergent and warm water. Wipe dry with a clean, soft cloth.

RF/RFS/RNS MODELS CLEANING/SANITIZING PROCEDURES

Cleaning/Sanitizing Procedure

This procedure must be performed once every month.

- All ice must be removed from the bin
- The ice machine and bin must be disassembled cleaned and sanitized
- The ice machine produces ice with the cleaner and sanitizer solutions
- All ice produced during the cleaning and sanitizing procedure must be discarded

Procedure to Clean/Sanitize

Use Ice Machine Cleaner part number 000000084.

Use Ice Machine Sanitizer part number 9405653.

Step 1 Remove front and top covers and set the toggle switch to the OFF position.

Step 2 Remove all ice from the bin.

Step 3 Turn off the ice making water supply and drain water from evaporator and reservoir.

Step 4 Remove the top cover from water reservoir.

Step 5 Follow the chart and premix cleaner and water.

Amount of Water	Amount of Cleaner Part Number 000000084
1 gallon (4 Liters)	3 ounces (90 ml)

Step 6 Fill the evaporator and reservoir with cleaning solution.

Prop Float Up to Prevent Low Water Level Shutdown

Step 7 Move the toggle switch to the ON position. The ice machine will make ice with the cleaning solution and deposit the ice in the bin. Add the remaining cleaner/water solution as the water level in the reservoir drops.

NOTE: Do not allow the cleaner/water level to drop below the minimum water level. The ice machine will discontinue the cleaning cycle if the water float switch opens.

Step 8 After all of the cleaner/water solution has been added turn on the ice making water supply. Continue the freeze cycle for 10 minutes to remove the cleaning solution from the water circuit.

Step 9 Place the toggle switch in the OFF position.

Step 10 Refer to disassembly for cleaning/sanitizing and remove parts for hand cleaning/sanitizing.

- Hand clean all parts
- Rinse all parts with clear potable water
- Sanitize all parts - do not rinse after sanitizing
- Spray all interior bin surfaces with sanitizer (do not rinse sanitized areas).
- Spray evaporator discharge spout

Step 11 Reassemble ice machine.

Step 12 Turn off the ice making water supply.

Step 13 Refer to chart and premix water and sanitizer.

Amount of Water	Amount of Sanitizer
1 Gallons (4 L) Water	1/2 ounce (15 ml)

Step 14 Fill the evaporator and reservoir with sanitizer/water solution.

Step 15 Move the toggle switch to the ON position. The ice machine will make ice with the sanitizer/water solution and deposit the ice in the bin. Add the remaining sanitizer/water solution when the water level in the reservoir drops.

NOTE: Do not allow the sanitizer/water level to drop below the minimum water level. The ice machine will discontinue the cleaning cycle if the water float switch opens.

Step 16 After all of the sanitizer/water solution has been added to the reservoir, turn on the ice making water supply.

Step 17 Continue the freeze cycle for 30 minutes and then discard all ice produced.

Heavily Scaled Cleaning Procedure

Perform this procedure if you have some or all of these symptoms.

- Excessive grinding, popping or squealing noises from the evaporator
- Grinding noise from gearbox
- Ice machine trips speed sensor

NOTE: A Cleaning/Sanitizing Procedure must be performed after this procedure.

Procedure to Clean Heavily Scaled Flake Ice Machines

Step 1 Remove front and top covers and set the toggle switch to the OFF position.

Step 2 Remove all ice from the bin.

Step 3 Turn off the ice making water supply.

Step 4 Remove the top cover from water reservoir.

Step 5 Refer to chart and premix cleaner with lukewarm water in a non-metallic container.

Model	Water Reservoir Capacity	Mix Cleaner and Water Use Ice machine nickel safe cleaner, part number 000000084 only	
		Cleaner	Water
RF0244 RNS0244 RF0266 RNS0308 RF0385 RNS0385 RF0388 RF0399 RF0644	14 oz (400 ml)	9 oz (266 ml)	5 oz (148 ml)
RF0300 RFS0300 RNS0308 RF0650 RFS0650	17 oz (500 ml)	11 oz (325 ml)	6 oz (177 ml)
RF1200 RFS1200	34 oz (1 L)	23 oz (680 ml)	11 oz (325 ml)
RF2300 RFS2300	68 oz (2 L)	46 oz (1.3 L)	22 oz (650 ml)

Step 6 Remove all water from the evaporator and water reservoir. Add the entire cleaner/water solution and re-install the reservoir cover.

Leave the cleaner/water solution in the evaporator for a minimum of 4 hours.

Step 7 Remove all cleaner/water from the evaporator and water reservoir.

Step 8 Follow the standard cleaning and sanitizing procedures.

PARTS REMOVAL FOR CLEANING/SANITIZING

Warning

Disconnect electric power to the ice machine at the electric switch box and wear rubber gloves and safety goggles (or face shield) while handling cleaner or sanitizer.

NOTE: Do not mix Cleaner and Sanitizer solutions together. It is a violation of Federal law to use these solutions in a manner inconsistent with their labeling.

1. Turn off the water supply to the ice machine at the water service valve.
2. Remove the components listed on the following pages for cleaning and sanitizing.
3. Soak the removed part(s) in a properly mixed solution of cleaner and water.

Solution Type	Water	Mixed With
Cleaner	1 gal. (4 L)	16 oz (500 ml) cleaner Part Number 000000084

4. Use a soft-bristle brush or sponge (NOT a wire brush) to carefully clean the parts.
5. Use the solution and a brush or sponge to clean all disassembled components and the inside of the bin.
6. Rinse all cleaned parts with clear water.
7. Mix a solution of sanitizer and water.

Solution Type	Water	Mixed With
Sanitizer	3 gal. (11 L)	2 oz (60 ml) sanitizer Part Number 94-0565-3

8. Soak the parts in the sanitizer/water solution for 10 minutes. Use the sanitizer/water solution and a sponge to sanitize all removed components and the inside of the bin. Do not rinse the sanitized parts.
9. Continue with step 11 of the cleaning/sanitizing procedure.

ICE CHUTE REMOVAL - RFS & RNS MODELS

RFS0300/RNS0308/RFS1200/RFS2300

NOTE: A limited number of RF models have this type of ice chute also.

1. Place the toggle switch in the OFF position, turn off the water supply and disconnect electrical power to the ice machine.
2. Disconnect water supply.
3. Remove water reservoir cover.
4. Remove microswitch and bin thermostat from the ice chute.
5. Remove retainer, ice chute elbow and ice chute.

ICE CHUTE REMOVAL - RF MODELS

RF0300/RF0650/RF1200/RF2300

NOTE: A limited number of these models have the ice chute listed on the previous page.

1. Place the toggle switch in the OFF position, turn off the water supply and disconnect electrical power to the ice machine.
2. Disconnect water supply.
3. Remove water reservoir cover.
4. Remove bin thermostat from ice chute.
5. Loosen bolts holding cross member.
6. Lift cross member and remove ice chute.

ICE CHUTE SWITCH ACTUATOR REMOVAL

RFS0300/RF0650/RF1200/RFS1200/RF2300/RFS2300

1. Pull to remove nylon end cap.
2. Slide pin to remove.
3. Remove both sections of the pressure switch bracket.

**INCORRECT REASSEMBLY CAN
RESULT IN AN ICE MACHINE
THAT WILL NOT RUN**

CLEANING SANITIZING PROCEDURE RN0400

Use Ice Machine Cleaner part number 000000084.

Use Ice Machine Sanitizer part number 94-0565-3.

Step 1 Disconnect power, remove front, top and right panels and set the compressor rocker switch to the OFF position.

Step 2 Remove all ice from the bin/dispenser.

Step 3 Turn off the ice making water supply.

Step 4 Drain water from evaporator and reservoir through the evaporator/reservoir drain line and reinsert hose into hose clip.

Step 5 Follow the chart and premix cleaner and water.

Amount of Luke Warm Water	Amount of Cleaner Part Number 000000084
1 gallon (4 Liters)	4 ounces (120 ml)

Step 6 Remove top cover from the water reservoir and fill the evaporator and reservoir with cleaning solution. Remainder of solution will be used for hand cleaning.

Step 7 Verify the compressor rocker switch is in the

OFF position, then reconnect power and run the gear motor for 15 minutes. Perform the following procedures during the 15 minute period:

- Remove ice compression nozzle from evaporator and soak in cleaning solution.
- Descale drain pan by gently flexing, then remove any scale residue.
- Inspect water feed and drain lines and clean as needed.
- Connect ice transport tube direct to evaporator and secure with hose clamp.

Step 8 Disconnect power, then drain the water from the evaporator and reservoir through the evaporator/reservoir drain line - Using a pitcher, fill and drain the evaporator/reservoir 4 times and reinsert the hose into the hose clip.

Step 9 Refer to chart and premix water and sanitizer.

Amount of Luke Warm Water	Amount of Sanitizer
1 Gallon (4 L) Water	1/2 ounce (15 ml)

Step 10 Fill reservoir and evaporator with sanitizer/water solution.

Step 11 Step 11 Verify the compressor rocker switch is in the OFF position, then reconnect power and run the gearmotor for 10 minutes.

- During the 10 minute period rinse cleaner from compression nozzle with potable water and then soak in sanitizer/water solution.

Step 12 Move the compressor rocker switch to the ON position. The ice machine will make ice with the sanitizer/water solution and deposit the ice in the bin/ dispenser. Make ice for 5 minutes - add sanitizer/water solution as the water level in the reservoir drops.

NOTE: Do not allow the sanitizer/water level to drop below the sensing probes. The ice machine will start a 20 minute delay period if the sensing probes lose contact with the water for more than 10 seconds.

Step 13 Move the compressor rocker switch to the OFF position and disconnect power.

Step 14 Drain the evaporator/reservoir and reinsert the drain hose into the hose clip.

Step 15 Reinstall the ice compression nozzle and reservoir cover. Verify the ice tube is in place and does not contact the condenser fan blade.

Step 16 Turn on the ice making water supply, reconnect power and move the compressor rocker switch to ON.

Step 17 Allow the ice machine to run for 10 minutes, then place the compressor rocker switch in the OFF position, disconnect power and discard all ice produced.

** Warning**

To prevent injury disconnect main supply power to the dispenser (when used) before cleaning or sanitizing.

Step 18 Clean and sanitize the bin/dispenser:

- Disconnect power to the dispenser to prevent injury.
- Use the cleaner and sanitizer ratios from the charts on Page 21.
- Heavy accumulations of scale may require removal of components for cleaning and sanitizing.
- Rinse parts with clear water after cleaning - do not rinse parts after sanitizing.
- Spray all interior bin/dispenser surfaces with sanitizer (do not rinse sanitized areas).

Step 19 Place the compressor rocker switch in the ON position, reinstall all removed panels and restore power to the ice machine and dispenser.

CLEANING THE AIR FILTER AND CONDENSER

Warning

Disconnect electric power to the ice machine at the electric service switch before cleaning the condenser. The condenser fins are sharp. Use care when cleaning them.

Air-Cooled Condenser

Clean the condenser at least every six months. Follow the steps below.

1. Some models have a washable filter. Clean the filter with a mild soap and water solution.
2. Shine a flashlight through the condenser to check for dirt between the fins. Blow compressed air through the condenser fins from the inside or use a commercial condenser coil cleaner. Follow the directions and cautions supplied with the cleaner.
3. Straighten any bent condenser fins with a fin comb.
4. Carefully wipe off the fan blades and motor with a soft cloth. Do not bend the fan blades. If the fan blades are excessively dirty, wash with warm, soapy water and rinse thoroughly.

Warning

If you are cleaning the condenser fan blades with water, cover the fan motor to prevent water damage.

Removal from Service/Winterization

Caution

If water is allowed to remain in the ice machine in freezing temperatures, severe damage to some components could result. Damage of this nature is not covered by the warranty.

Follow the procedure below.

1. Disconnect the electric power at the circuit breaker or the electric service switch.
2. Turn off the water supply.
3. Disconnect and drain the incoming ice-making water line at the rear of the ice machine.
4. Disconnect drain tubing and drain water into container and discard.
5. Make sure water is not trapped in any of the water or drain lines.
6. Water cooled - Use compressed air to remove all water from the condenser.

Sequence of Operation

Ice Making Sequence of Operation

NOTE: Flake ice machines use an auger to remove ice from the evaporator. Occasional noises (creaks, groans, squeaks, or pops) are a normal part of the ice making process.

**RF0244/RNS0244/RF0266/RF0385/RFS0385/
RNS0385/RF0388/RF0399**

Self-Contained Air-Cooled

When the toggle switch is placed in the "ON" position the following controls must be in the closed position before the ice machine will start:

- A. Bin Thermostat
- B. Low Evaporator Temperature Thermostat
- C. Low Water Level Switch

Placing the toggle switch in the ON position starts the gear motor and refrigeration system. The float valve controls the water inlet valve and water level. The freeze cycle ends when ice contacts the bin thermostat. The ice machine will restart when ice no longer contacts the bin thermostat.

RF0300

Self-Contained Air-Cooled

When the toggle switch is placed in the "ON" position the following controls must be in the closed position before the ice machine will start:

- A. Bin Thermostat
- B. Ice Chute Safety Switch
- C. Low Water Level Switch
- D. Low Evaporator Temperature Thermostat

Placing the toggle switch in the ON position starts the gear motor and a 10 minute compressor time delay. The compressor starts and the float valve controls the water inlet valve and water level. The freeze cycle ends when ice contacts the bin thermostat. The ice machine remains off until ice no longer contacts the bin thermostat.

RFS0300/RNS0308

Self-Contained Air-Cooled

When the toggle switch is placed in the "ON" position the following controls must be in the closed position before the ice machine will start:

- A. Bin Thermostat
- B. Ice Chute Safety Switch
- C. Low Water Level Switch
- D. High Pressure Cut-out Switch
- E. Low Pressure Cut-Out Switch

Placing the toggle switch in the ON position starts the gear motor and a 10 minute compressor time delay. The compressor starts and the float valve controls the water inlet valve and water level. The freeze cycle ends when ice contacts the bin thermostat. The ice machine remains off until ice no longer contacts the bin thermostat.

RF0644/RF0650/RF1200/RFS1200/RF2300/RFS2300

Self-Contained Air-Cooled

When the toggle switch is placed in the ON position the following controls must be in the closed position before the ice machine will start:

- A. Bin Thermostat
- B. High Pressure Cut-out Switch
- C. Ice Chute Safety Switch
- D. Low Pressure Switch
- E. Low Water Level Switch

Placing the toggle switch in the ON position starts the gear motor. After the rotation speed sensor verifies 10 minutes of correct rotation the time delay ends and the compressor starts. The ice machine will continue to make ice until ice contacts the bin thermostat. The ice machine remains off until ice no longer contacts the bin thermostat.

RF1200C/RF2300C

QuietQube Remote Air-cooled Models with Remote Condensing Unit

When the toggle switch is placed in the ON position the following controls must be in the closed position before the ice machine will start:

- A. Bin Thermostat
- B. High Pressure Cut-out Switch
- C. Ice Chute Safety Switch
- D. Low Pressure Switch
- E. Low Water Level Switch

Placing the toggle switch in the ON position starts the gear motor. After the rotation speed sensor verifies 10 minutes of correct rotation the time delay ends and the liquid line solenoid valve opens.

- When the refrigerant pressure is high enough to close the low-pressure control the contactor coil energizes and the compressor starts.
- The refrigerant pressure will increase and close the fan cycling pressure control and the condenser fan motor starts.

The ice machine will continue to make ice until ice contacts the bin thermostat and the liquid line solenoid valve closes and the refrigeration system pumps down.

- The refrigerant pressure drops and the fan cycling pressure control opens stopping the condenser fan motor.
- When the refrigerant pressure is low enough to open the low pressure control, the contactor coil is de-energized and the compressor stops.

The ice machine remains off until ice no longer contacts the bin thermostat.

RF1200C/RF2300C

Head Section with Rack Refrigeration system

When the toggle switch is placed in the ON position the following controls must be in the closed position before the ice machine will start:

- A. Bin Thermostat
- B. Ice Chute Safety Switch
- C. Low Water Level Switch

Placing the toggle switch in the ON position starts the gear motor. After the rotation speed sensor verifies 10 minutes of correct rotation the time delay ends and the liquid line and suction solenoid valves energize.

The ice machine will continue to make ice until ice contacts the bin thermostat and the liquid line and suction solenoid valves close.

The ice machine remains off until ice no longer contacts the bin thermostat.

RN0400

Self-Contained Air-Cooled & Water-Cooled

NOTE: Ice machines use an auger to remove ice from the evaporator. Occasional noises (creaks, groans, squeaks, or pops) are a normal part of the ice making process.

Operation

The ice machine will not start until:

- A. The compressor rocker switch is moved to "ON".
- B. Ice does not contact the bin thermostat bulb.
- C. The water reservoir is full of water.

With power supplied and the compressor rocker switch in the ON position, the gear motor and refrigeration system start. The float valve controls the water inlet valve and water level. The freeze cycle ends when ice contacts the bin thermostat. A 20 minute delay period initiates. The ice machine will restart when ice no longer contacts the bin thermostat and the 20 minute delay period expires.

Step 1 Initial Startup

With power supplied to the control board the PWR (power) light is energized. The bin thermostat closes (BE light on) and the water level probe checks for water.

Step 2 Gear Motor & Compressor Startup

The WTR light energizes and the gear motor, compressor and fan motor start. Two additional lights energize DR (drive) and C (compressor).

Step 4 The bin/dispenser fills and the bin thermostat opens. The BE light de-energizes and 10 seconds later the BT light energizes and the C light de-energizes. The compressor and fan motor stop, although the gear motor will run for an additional 60 seconds.

Step 5 The BT light is energized for 20 minutes to indicate the machine is in the 20 minute time delay period. Pressing the control board reset button cancels the time delay.

Step 6 After 20 minutes the BT light de-energizes. The PWR and WTR lights remain energized. When the bin thermostat closes the ice machine starts at step 1.

RN1000/RN1400

Self-Contained Air-Cooled & Water-Cooled

NOTE: Ice machines use an auger to remove ice from the evaporator. Occasional noises (creaks, groans, squeaks, or pops) are a normal part of the ice making process.

Operation

The ice machine will not start until:

- A. The rocker switch is moved to ON.
- B. The transport tube shuttle switch is closed.
- C. The water reservoir is full of water.

Placing the toggle switch in the ON position starts the gear motor and refrigeration system. The water level sensor controls the water inlet valve and water level. The freeze cycle ends when ice contact opens the transport tube switch. A 60 minute time delay period initiates. The ice machine will restart when the ice transport tube switch closes and the 60 minute time delay period expires.

Flush Cycle

The ice machine will automatically flush the evaporator.

The refrigeration system will shut down and the gear motor will continue to run. After the flush is complete, the machine will refill and start the refrigeration system without a time delay.

RN1000/RN1400 Indicator lights

INDICATOR LIGHT LEGEND

ON

OFF

ON or OFF

FLASHING

- With line voltage supplied the green Power light is on and the CPU light flashing a heartbeat indicates the central processing unit is working.
- Yellow lights indicate normal off conditions.
- Red lights indicate an alarm condition.

The sequence below is for normally operating machines. For alarm conditions refer to troubleshooting which starts on page 133.

Step 1 Freeze cycle normal light operation

The CPU light flashes and the Refrigeration, Auger on, Low bin and Power lights are on.

CPU (G)	LO WATER (R)	HI WATER (R)	DRAIN CLOG (R)	LO PRESS (R)	HI PRESS (R)	HI AMPS (R)	SERVICE (R)	PURGE (Y)	CLEANING (Y)	TIME DELAY (Y)	REFRIG ON (G)	AUGER ON (G)	LOW BIN (G)	POWER (G)

Step 2 Time delay cycle normal light operation

The bin fills with ice, the Low Bin light de-energizes and the Time delay light energizes. The compressor and gear motor immediately turn off and the condenser fan continues to run for 10 minutes before turning off. When the time delay ends and the Low bin light energizes the ice machine will restart.

Step 3 Purge cycle normal light operation

After 1 to 2 hours of ice making the control board will initiate a purge cycle. The compressor de-energizes and the gear motor and condenser fan motor continue to run. After the purge cycle is complete the ice machine starts without a time delay period.

RN1000C/RN1200C

QuietQube Remote Air-cooled Model with Remote Condensing Unit

NOTE: Ice machines use an auger to remove ice from the evaporator. Occasional noises (creaks, groans, squeaks, or pops) are a normal part of the ice making process.

Operation

The ice machine will not start until:

- A. The rocker switch is moved to ON.
- B. The transport tube switch is closed.
- C. The water reservoir is full of water.

Placing the toggle switch in the ON position starts the gear motor and energizes the liquid line solenoid valve. The refrigerant pressure at the condensing unit increases and the low pressure switch closes and starts the refrigeration system. The water level sensor controls the water inlet valve and water level. The freeze cycle ends when ice contact opens the transport tube switch. The liquid line solenoid valve closes and the refrigerant pressure at the condensing unit drops. The low pressure switch opens and turns off the refrigeration system. A 60 minute time delay period initiates. The ice machine will restart when the ice transport tube switch closes and the 60 minute time delay period expires.

RN1000/RN1400 Indicator lights

INDICATOR LIGHT LEGEND

ON

OFF

ON or OFF

FLASHING

- With line voltage supplied the green Power light is on and the CPU light flashing a heartbeat indicates the central processing unit is working.
- Yellow lights indicate normal off conditions.
- Red lights indicate an alarm condition.

The sequence below is for normally operating machines. For alarm conditions refer to troubleshooting which starts on page 133.

Step 1 Freeze cycle normal light operation

The CPU light flashes and the Refrigeration, Auger on, Low bin and Power lights are on.

CPU (G)	LO WATER (R)	HI WATER (R)	DRAIN CLOG (R)	LO PRESS (R)	HI PRESS (R)	HI AMPS (R)	SERVICE (R)	PURGE (Y)	CLEANING (Y)	TIME DELAY (Y)	REFRIG ON (G)	AUGER ON (G)	LOW BIN (G)	POWER (G)

Step 2 Time delay cycle normal light operation

The bin fills with ice, the Low Bin light de-energizes and the Time delay light energizes. The compressor and gear motor immediately turn off and the condenser fan continues to run for 10 minutes before turning off. When the time delay ends and the Low bin light energizes the ice machine will restart.

Step 3 Purge cycle normal light operation

After 1 to 2 hours of ice making the control board will initiate a purge cycle. The compressor de-energizes and the gear motor and condenser fan motor continue to run. After the purge cycle is complete the ice machine starts without a time delay period.

Ice Production/Quality Check

QUALITY CHECK

Ice quality varies with ambient and water temperatures, and is measured by the amount of water in the ice. Generally speaking, higher incoming water temperature results in lower ice quality. Lower water temperature results in higher ice quality.

ICE PRODUCTION CHECK

NOTE: Ice production checks that are within 10% of the charted capacity are considered normal due to variances in air and water temperatures. Actual temperatures will seldom match the chart exactly.

1. Run the ice machine a minimum of 10 minutes to allow the system to stabilize.
2. Catch the ice in a non-perforated container for 7 minutes and 12 seconds or for more accuracy 14 minutes and 24 seconds.
3. Weigh the container and ice, then deduct the weight of the container.
4. Convert ounces to pounds.
5. Example: 3 lbs. 12 oz. converts to 3.75 lbs.
6. $(12 \text{ oz.} \div 16 \text{ oz.} = .75 \text{ lb.})$
7. Determine the 24-hour ice production capacity.
 - A. 7 minutes 12 seconds = Multiply the total ice weight by 200.
 - B. 14 minutes 24 seconds = Multiply the total ice weight by 100.

Thermostat Settings

Bin Thermostat:

The bin thermostat sensing bulb is located in the ice chute on modular models and in the bin thermostat holder on the right side of the bin on self storage models. The bin thermostat turns the ice machine on and off as the level of ice in the bin changes. Use the indicator on the ice machine label as the initial setting and adjust as required.

Evaporator Low Temperature Safety Thermostat:

The evaporator low temperature safety thermostat protects the ice machine if the evaporator temperature is too cold. Refer to chart for correct setting.

Bin Thermostat

Small Numbers = Less ice in bin
Large Numbers = More ice in bin
Start at Chart Setting, then adjust
as required

Evaporator Low Temperature Safety Thermostat

Refer to chart for setting
Incorrect settings will cause ice
machine to shut off prematurely

Thermostat Setting Chart

NOTE: Settings are for reference only. Factory setting is indicated on control label and overrides information listed on this page.

Troubleshooting

Diagnostic troubleshooting for the ice machine involves following flowcharts that are dependent on symptoms of the failed machine.

Follow the flowcharts for the failure symptom and model you are working on.

NOTE: Refer to the sequence of operation to determine where in the sequence the ice machine has failed. An example would be an ice machine that energizes the gear motor, but the compressor does not energize. Following the electrical flowchart will quickly and easily eliminate non issues.

RN0400 Troubleshooting

NOTE: Refer to “RN0400” on page 29 for normal sequence of operation.

OVER-TORQUE FAILURE

Step 1 The ice machine stops and the 20M light energizes. The PWR, WTR and BE lights remain energized. The ice machine restarts after 20 minutes.

Step 2 Successful restart and normal operation - The 20M light de-energizes and the 60M light energizes. After 60 minutes of normal operation the 60M light de-energizes.

Step 3 Unsuccessful restart or abnormal operation - The 60M light de-energizes and the 2ND light energizes. The reset button on the control board must be pressed to restart the ice machine.

WATER LOSS FAILURE

The ice machine stops and the BT light energizes and the WTR light de-energizes. If water is restored the WTR light will flash as an indicator. The flashing WTR light can be cleared by pressing the reset button on the control board.

RN1000/RN1400 Troubleshooting

NOTE: Refer to "RN1000/RN1400" on page 36 for normal sequence of operation

INDICATOR LIGHT OPERATION

The lights on the control board can be used as quick failure mode indicators. If the failure mode isn't obvious from the light indicators, use the flowchart to systematically eliminate issues.

NOTE: Each relay on the control board has a light adjacent to the relay to indicate the relay coil has power.

CONTROL BOARD ERRORS

The control board monitors the following:

Low water

Gear motor amperage

High pressure

Clogged drain

There are two different errors - Soft errors and hard errors.

- Soft errors can be reset by cycling power on/off.
- Hard errors can not be cleared by cycling power on/off and must be reset by pressing the control board reset button.

LO WATER - WATER LEVEL IS BELOW LOW WATER SENSOR FOR MORE THAN 120 SECONDS

Soft Error

The control board stops the ice machine, energizes the Lo Water & Service lights and leaves the water solenoid energized. When water contacts the low water probe the ice machine will resume ice making.

Hard Error

The water level sensor has 4 probes and the 2 longest probes reach to the bottom of the water reservoir. When no water is sensed on these probes within 60 seconds of power up (or the water level sensor is disconnected or shorted) the control board stops the ice machine and energizes the Lo Water light. The ice machine must be reset by pressing the control board reset button.

HI AMPS - GEAR MOTOR AMPERAGE EXCEEDS 3.8 AMPS

Soft Error

The control board stops the ice machine, energizes the Hi Amps & Service lights and initiates a time delay period. The ice machine will restart after the 60 minute delay. The ice machine continues to run if amperage remains below 3.8 amps for six hours.

Hard Error

Gear motor amperage exceeds 3.8 amps a second time, within six hours of the first failure. The ice machine must be reset by pressing the control board reset button.

HI PRESSURE

Soft Error

If the refrigeration pressure exceeds 425 psi (2930 kPa) the ice machine will turn off, energize the Hi Press light and initiate a 60 minute delay period. If the refrigeration pressure is below 295 psi (2034 kPa) at the end of the delay period the ice machine will restart.

DRAIN CLOG

Soft error

When the drain sensor (located in the drain pan behind the drain solenoid) detects water, the ice machine will energize the Drain Clog light and turn off until reset.

NOTE: All ice machines are charged using R-404A refrigerant.

Model	Additional refrigerant required for 51' to 100' (15.5 to 30.5 m) line sets
RF1200C	0 lbs 0 kgs
RFS1200C	0 lbs 0 kgs
RF2300C	0 lbs 0 kgs
RN1000C	2 lbs 907g
RN1200C	2 lbs 907g
RNS1078C	2 lbs 907g

FILTER-DRIERS

The size of the filter-drier is important. The refrigerant charge is critical. Using an improperly sized filter-drier will cause the ice machine to be improperly charged with refrigerant.

Important

Driers are covered as a warranty part. The drier must be replaced any time the system is opened for repairs.

SUCTION CLEANUP FILTER-DRIER

Contaminated systems must have a suction line filter-drier installed to remove contaminations. An access valve must be installed on the inlet side of the suction filter to allow pressure drop readings to be obtained.

Suction Line Clean-Up Filter		
Model	Drier Size	End Connection Size
All Models	UK-165S	5/8 in.

THIS PAGE INTENTIONALLY LEFT BLANK

Charts

Total System Refrigerant Charge

Important

This information is for reference only. Refer to the ice machine serial number tag to verify the system charge. Serial plate information overrides information listed on this page.

Ice Production & Refrigerant Pressure

These charts are used as guidelines to verify correct ice machine operation.

Accurate collection of data is essential to obtain the correct diagnosis.

- Zero out manifold gauge set before obtaining pressure readings to avoid misdiagnosis.
- Discharge and suction pressure are highest at the beginning of the cycle. Allow system to stabilize for a minimum of 10 minutes, then verify the pressures are within the range indicated.
- Water temperature will affect suction and discharge pressure - 50°F (10°C) water temperature will result in pressures on the lower end of the ranges specified. 90°F (32°C) water temperatures will result in pressures on the upper end of the range specified.
