

How to Apply

Every mole invasion is different, so it is important to think about your strategy before applying the granules. You should first identify the mole areas with the most activity and decide which direction to herd them out of the yard. Note: Application may require more steps depending on the size of your yard.

- **Day 1** - Spread the granules over the first area and water-in with a sprinkler for approximately 20 minutes. Watering allows the concentrated granules to penetrate deeply into the lawn.
- **Day 2** - Spread the granules over the second area. Water-in the same area as Day 1, as well as the second area to get the mole moving. Each day's watering allows the granules to penetrate more deeply.
- **Day 3** - Spread granules over the third area. Water-in the same areas as Day 1 and 2, as well as the third area to keep the mole moving.
- **Day 4** - Spread the granules over the fourth area. Water-in the same areas as Days 1, 2, and 3, as well as the fourth area to move the mole out of the yard.
