

How To Cold Brew Using the Curtis TC-6HK and TC-7HK

What you will need

TC-6HK

6.0 Gallon

Cold Brew Coffee System

TC-7HK

7.0 Gallon

Cold Brew Coffee System

✓ **1 Reusable Toddy** *Nylon Strainer*

✓ **1 Toddy** *Commercial Paper Filter (one time use)*

✓ **4 Gallons** *fresh filtered water ambient temp*

✓ **5 Pounds** *medium to dark coffee, coarsely ground*

✓ **1 String**

Instructions

1

Place coffee strainer inside TC-6H or TC-7H, wrapping the elastic edges over the top of the container to keep in position.

2

Place the paper filter *inside nylon coffee strainer.*

3

Carefully put **5 lbs of ground coffee** in the paper filter.

4

Slowly pour 1 gallon of water in a circular motion over the coffee grounds making sure grounds are *evenly saturated.*

5

Tie the paper filter closed with a string at the top, leaving room for coffee grounds to expand.

6

Pour the remaining 3 gallons of water over the paper filter with the coffee in it.

7

Put the lid on and steep for **12-16 hours.**

8

Take lid off and lift up the coffee strainer with the paper filter and coffee, letting coffee drain into the TC-6H or TC-7H completely.

9

Discard the paper filter and ground coffee, but **keep the coffee strainer** as it is reusable.

10

Approximately 2.5 gallons of concentrate will be in the container. Add water to the coffee concentrate per your recipe and **serve over ice.**
